

# Giant hogweed

*Heracleum mantegazzianum*

## Why is giant hogweed a problem?

Giant hogweed is a serious health hazard. The clear, watery sap in the leaves and stems contains a phototoxin that causes human skin to be hypersensitive to sunlight, resulting in burns and blisters. Scars can last a year or more and direct contact with eyes can result in temporary or permanent blindness.

**WARNING:**  
*If sap from giant hogweed gets on skin, immediately wash with soap and water and keep exposed skin out of the sun. Treat as you would a surface burn.*

Giant hogweed is a highly competitive and invasive plant due to vigorous early season growth, high range of tolerances, ability to thrive in disturbed sites and height of flower stalk allowing for efficient spread of seeds.

Winged seeds are also dispersed by water or soil movement and can float up to three days allowing them to travel great distances. The relatively shallow roots do not hold soil well when the plant dies back in winter exposing soil to high rates of erosion.

## Recognizing giant hogweed

Giant hogweed is a perennial that flowers in the 2nd or 3rd year. It can grow 10-15 feet tall and has dark reddish-purple spotted stems and leaf stalks with dense, stubby hairs that cover both. Stems can be two to four inches in diameter with large deeply incised compound leaves that are three to five feet wide.

Flowers bloom mid-May to July with numerous large, umbrella-shaped white flower clusters that can be up to two and a

half feet in diameter across the top. Seeds are winged. Giant hogweed is usually found in ravines, parks, wooded open spaces, roadside ditches and wetlands. The plant prefers partial shade but can grow in full shade to full sun.

Giant hogweed is similar in appearance to native cow parsnip. Giant hogweed is much larger however, the purple blotches are more raised and bumpy, and the hairs underneath leaves are shorter.

## YOU can help stop the spread of noxious weeds

- Report infestations
- Actively control noxious weeds on your property
- Contact Clark County's Vegetation Management Program for more information on species ID and recommended control methods
- Spread the word about noxious weeds, and why controlling them is so important

Remember, weeds are everyone's problem. Controlling noxious weeds on your property is your responsibility and the law.

VEGETATION MANAGEMENT PROGRAM

Why control noxious weeds in Clark County?

Noxious weeds are non-native plants that can be toxic, destructive, competitive and difficult to control once established.

**Economics** - Noxious weeds cost the United States on average 30.6 billion dollars each year in decreased land value, money and time spent in control efforts, lower crop yields, reduced forage quality and impacts on animal health.

**Environmental health** - Noxious weeds displace native species, destroy natural habitat, clog waterways and increase erosion and fire risk.

**Human & animal health** - Many noxious weeds are toxic to humans and livestock. Contact or ingestion of some species can lead to serious health problems or death.

**Recreation** - Noxious weeds hurt recreation opportunities such as bird watching and fishing through reduced accessibility and destruction of native landscapes.

Integrated Weed Management (IWM)

An Integrated Weed Management plan is an ongoing, continuing cycle of weed prevention, control, monitoring, evaluation and planning

Managing weeds with Integrated Weed Management

The most effective way to manage weed infestations is to use a combination of control methods specific to the problem weed, where it is in its growth-cycle, and the location where it is growing. This approach is called integrated weed management, or IWM, which uses biological, mechanical, cultural, and chemical (herbicide) control methods that treat the problem weed yet protect human health, habitat, water, and other natural resources.

**Prevention is better than control** - The best control method of all is to prevent weeds in the first place. IWM starts with understanding the soil, water, natural resources and human impacts and uses on a site. For example, weeds often invade due to overgrazing, bare soil, or other factors that should be corrected for the control measures to be fully effective.

**Long-term effectiveness** – A good IWM plan is more effective than complete reliance on herbicide management. While not all control methods are useful for all weed species, taking an integrated approach to weed management can greatly increase the effectiveness of your efforts. As weed control is not a one-time fix, an IWM strategy should be practical, adaptable, cost-efficient, and effective.

IWM control recommendations for giant hogweed

IWM control type	Control method		Effectiveness of control method							
			Small/backyard site				large/rural site			
			Good	Fair	Poor	N/A	Good	Fair	Poor	N/A
Physical & mechanical	digging		●							●
	hand-pulling					●				●
	mowing					●				●
	tilling					●				●
Cultural	bark mulch					●				●
	black plastic			●						●
	cover crop					●				●
	native plant restoration					●				●
	soil amendment					●				●
Biological	managed grazing					●				●
	weed-feeding insects					●				●
		Product examples *								
Chemical	aminopyralid	Milestone	●				●			
	glyphosate	Roundup, AquaNeat, Rodeo		●					●	
	triclopyr amine	Garlon 3A, Lilly Miller Brush Killer	●				●			

\* Brand names are listed as an example only. Other commercial products may contain the listed chemical control. Clark County does not endorse any product or brand name. Always read and follow the herbicide label. For more information on specific herbicides, please contact Vegetation Management.
